From his decade of experience at fast-growing web technology companies, Lee has written the book Architecting for Scale, from O'Reilly. As an application scales, it becomes significantly more complicated while at the same time receiving more traffic. The intersection of these two problems leads to a variety of discussions around availability, risk management, and microservices. Sponsorship ...

The goal is to scale. Much like cell phones, cars, televisions, washing machines, and toys, "the things that become productized become better and better at a lower and lower cost. And we want to apply that to the places where we live," says Ingels. "We are not interested in milking every transaction for maximum value. We are actually interested in the idea of partnering with our tenants ...

The first two approaches are the extremes on the scale from few large to many small clusters, as shown below: In general, a cluster can be defined "larger" than another if it contains a larger sum of nodes and Pods — for example, a cluster with 10 nodes and 100 Pods is larger than a cluster with 1 node and 10 Pods. Let's get started! 1. One large shared cluster. The first option is to run ...

Every project is different in terms of scale and functionality. There is no single approach or generalization that will work every time, therefore, it's necessary to have a plan before actual coding begins. While doing so it is very easy to recognize which tools are right for you and which ones would be an overkill. An app with 2-3 pages and minimal API calls would not require datastores as ...

Architecting a ML Pipeline. Traditionally, pipelines involve overnight batch processing, i.e. collecting data, sending it through an enterprise message bus and processing it to provide pre-calculated results and guidance for next day's operations. Whilst this works in some industries, it is really insufficient in others, and especially when it comes to ML applications. The following diagram ...
