can be thought of as the coordination and integration system within organisms. The CNS takes signals from the peripheral nervous system, processes them, then creates new signals to coordinate actions of different body systems. For instance, long-term and short-term metabolism and homeostasis are regulated through close interaction between the central ...

The nervous system has two main parts: The central nervous system is made up of the brain and spinal cord. The peripheral nervous system is made up of nerves that branch off from the spinal cord and extend to all parts of the body. The nervous system transmits signals between the brain and the rest of the body, including internal organs. In this way, the nervous system's activity controls ...
