Figure 7 shows the system used for large industrial plants where most of the load consists of motors. It is a 480-volt delta three-phase system. This system uses transformers to obtain 120/240-volt requirements. The terms "grounding" or "grounded" and "ground" can be confusing.

Electricity 101: Basic Fundamentals | Industrial Controls

Electric motors consume almost 50% of the world's electricity. With the cost of energy rising steadily, industry is focused on replacing inefficient constant-speed motors and drives with microprocessor-based, variable-speed drives. This new motor-control technology will reduce energy consumption by more than 30% compared to the older drives.

Overview of Industrial Motor Control Systems - Tutorial ...

In many commercial and industrial applications, quite a few electric motors are required, and it is often desirable to control some or all of the motors from a central location. The apparatus designed for this function is the motor control center (MCC). Motor control centers are simply physical groupings of combination starters in one assembly.

The PLC is usually part of a control circuit supplied with 120VAC through a 460V/120V transformer as part of a system with motors, controllers, safety circuits, and other controls; occasionally, cycling the main 480V power off/on will be necessary to try to reset all the safety and control circuits

Industrial Electrical Troubleshooting - Motors

Motor Control devices provide the electrical control required to run a given motor. There are three main types of motor controllers: contactors, thermal overloads, and manual motor starters. Contactors provide remote electronic switching of electrical circuits, and thermal overloads provide overload protection for the electrical circuits.
