NORMAL FLORA ARE MUTUALISTIC

DR.T.V.RAO MD 23 • Much is not known about the nature of the associations between humans and their normal flora, but they are thought to be dynamic interactions rather than associations of mutual indifference. Both host and bacteria are thought to derive benefit from each other, and the associations are, for the most part, mutualistic. The normal flora derive ...

Normal Human Flora - SlideShare

The willingness of humans to kill other members of their species en masse through organized conflict (i.e., war) has long been the subject of debate. One school of thought is that war evolved as a means to eliminate competitors, and has always been an innate human characteristic. The other suggests that war is a relatively recent phenomenon and appeared due to changing social

Biodiversity is not evenly distributed, rather it varies greatly across the globe as well as within regions. Among other factors, the diversity of all living things depends on temperature, precipitation, altitude, soils, geography and the presence of other species. The study of the spatial distribution of organisms, species and ecosystems, is the science of biogeography.
